### **Description**

The lulccR package is an open and extensible framework for land use change modelling in R.

#### **Details**

The aims of the package are as follows:

- 1. to improve the reproducibility of scientific results and encourage reuse of code within the land use change modelling community
- 2. to make it easy to directly compare and combine different model structures
- 3. to allow users to perform every aspect of the modelling process within the same environment

To achieve these aims the package utilises an object-oriented approach based on the S4 system, which provides a formal structure for the modelling framework.

Models are represented by objects inheriting from the superclass Model. This class is designed to represent general information required by all models while specific models are represented by its subclasses. Currently the package includes two inductive land use change models: the first is an implementation of the Change in Land Use and its Effects at Small Regional extent (CLUE-S) model (Verburg et al., 2002) (class CluesModel), while the second is an ordered procedure based on the algorithm described by Fuchs et al. (2013) but modified to allow stochastic transitions (class OrderedModel).

The main input to land use change models is a set of predictive models relating observed land use or land use change to spatially explicit explanatory variables. A predictive model is usually obtained for each category or transition. In lulccR these models are represented by the class PredModels. Currently lulccR supports binary logistic regression, provided by base R (glm), recursive partitioning and regression trees, provided by package rpart and random forest, provided by package randomForest. To a large extent the success of the allocation routine depends on the strength of the predictive models: this is one reason why an R package for land use change modelling is attractive.

To validate model output lulccR includes a method developed by Pontius et al. (2011) that simultaneously compares a reference map for time 1, a reference map for time 2 and a simulated map for time 2 at multiple resolutions. In lulccR the results of the comparison are represented by the

4 lulccR-package

class ThreeMapComparison. From objects of this class it is straightforward to extract information about different sources of agreement and disagreement, represented by the class AgreementBudget, which can then be plotted. The results of the comparison are conveniently summarised by the figure of merit, represented by the classFigureOfMerit.

In addition to the core functionality described above, lulccR inludes several utility functions to assist with the model building process. Two example datasets are also included.

print(p)
```

6 AgreementBudget

AgreementBudget

Create an AgreementBudget object

#### **Description**

This function quantifies sources of agreement and disagreement between a reference map for time 1, a reference map for time 2 and a simulated map for time 2 to provide meaningful information about the performance of land use change simulations.

#### Usage

```
AgreementBudget(x, ...)

## S4 method for signature ThreeMapComparison
AgreementBudget(x, ...)

## S4 method for signature RasterLayer
AgreementBudget(x, ...)
```

#### **Arguments**

x a ThreeMapComparison object or RasterLayer
 ... additional arguments to ThreeMapComparison. Only required if x is not a ThreeMapComparison object

#### **Details**

The types of agreement and disagreement considered are those descibed in Pontius et al. (2011):

- 1. Persistence simulated correctly (agreement)
- 2. Persistence simulated as change (disagreement)
- 3. Change simulated incorrectly (disagreement)
- 4. Change simulated correctly (agreement)
- 5. Change simulated as persistence (disagreement)

### Value

An AgreementBudget object.

### References

Pontius Jr, R.G., Peethambaram, S., Castella, J.C. (2011). Comparison of three maps at multiple resolutions: a case study of land change simulation in Cho Don District, Vietnam. Annals of the Association of American Geographers 101(1): 45-62.

#### See Also

A greement Budget-class, A greement Budget.plot, Three Map Comparison, Figure Of Merit

AgreementBudget-class

7

#### **Examples**

AgreementBudget-class Class AgreementBudget

#### **Description**

An S4 class for information about sources of agreement and disagreement between three categorical raster maps.

#### **Slots**

tables list of data.frames that depict the three dimensional table described by Pontius et al. (2011) at different resolutions

factors numeric vector of aggregation factors

categories numeric vector of land use categories

labels character vector corresponding to categories

overall data.frame containing the overall agreement budget

category list of data.frames showing the agreement budget for each category

transition list of data.frames showing the agreement budget for all possible transitions

AgreementBudget.plot Plot method for AgreementBudget objects

### **Description**

Plot an AgreementBudget object.

#### Usage

```
AgreementBudget.plot(x, ...)
## S4 method for signature AgreementBudget
AgreementBudget.plot(x, from, to,
   col = RColorBrewer::brewer.pal(5, "Set2"), key, scales, xlab, ylab, ...)
```

8 allocate

### **Arguments**

X	an AgreementBudget object
from	optional numeric value representing a land use category. If provided without to the figure of merit for all transitions from this category will be plotted
to	similar to from. If provided with a valid from argument the transition defined by these two arguments (i.e. from -> to) will be plotted
col	character specifying the plotting colour. Default is to use the 'Set2' palette from RColorBrewer
key	list. See lattice::xyplot
scales	list. See lattice::xyplot
xlab	character or expression. See lattice::xyplot
ylab	character or expression. See lattice::xyplot
	additional arguments to lattice::xyplot

### **Details**

The plot layout is based on work presented in Pontius et al. (2011)

#### Value

A trellis object.

### References

Pontius Jr, R.G., Peethambaram, S., Castella, J.C. (2011). Comparison of three maps at multiple resolutions: a case study of land change simulation in Cho Don District, Vietnam. Annals of the Association of American Geographers 101(1): 45-62.

```

### Examples

## see AgreementBudget examples

allocate	Allocate land use change spatially	

### **Description**

Perform spatially explicit allocation of land use change using different models. Currently the function provides an implementation of the Change in Land Use and its Effects at Small regional extent (CLUE-S) model (Verburg et al., 2002) and an ordered procedure based on the algorithm described by Fuchs et al., (2013), modified to allow stochastic transitions.

allocate 9

#### **Usage**

```
allocate(model, ...)
## S4 method for signature CluesModel
allocate(model, ...)
## S4 method for signature OrderedModel
allocate(model, stochastic = TRUE, ...)
```

### **Arguments**

model an object inheriting from class Model

stochastic logical indicating whether the model should be run stochastically. Only used if

model is an OrderedModel object

... additional arguments for specific methods

#### Value

An update Model object.

#### References

Fuchs, R., Herold, M., Verburg, P.H., and Clevers, J.G.P.W. (2013). A high-resolution and harmonized model approach for reconstructing and analysing historic land changes in Europe, Biogeosciences, 10:1543-1559.

sib.clues.model <- sibuyan$intermediate$clues.model
## allocate
sib.clues.model <- allocate(sib.clues.model)
library(raster)
plot(sib.clues.model@output[[15]])</pre>
```

10 allow

allow

Implement decision rules for land use change

### **Description**

Identify legitimate transitions based on land use history and specific transition rules.

#### Usage

```
allow(x, categories, cd, rules, hist = NULL, ...)
```

#### **Arguments**

х	numeric vector containing the land use pattern for the current timestep
categories	numeric vector containing land use categories in the study region
cd	numeric vector indicating the direction of change for each land use category. A value of 1 means demand is increasing (i.e. the number of cells belonging to the category must increase), -1 means decreasing demand and 0 means demand is static
rules	matrix. See details
hist	numeric vector containing land use history (values represent the number of timesteps the cell has contained the current land use category). Only required for rules 2 and 3 $$
	additional arguments (none)

### **Details**

Decision rules are based on those described by Verburg et al. (2002). The rules input argument is a square matrix with dimensions equal to the number of land use categories in the study region where rows represent the current land use and columns represent future transitions. The value of each element should represent a rule from the following list:

- 1. rule == 0 | rule == 1: this rule concerns specific land use transitions that are allowed (1) or not (0)
- 2. rule > 100 & rule < 1000: this rule imposes a time limit (rule-100) on land use transitions, after which land use change is not allowed. Time is taken from hist
- 3. rule > 1000: this rule imposes a minimum period of time (rule-1000) before land use is allowed to change

allow should be called from allocate methods. The output is a matrix with the same dimensions as the matrix used internally by allocation functions to store land use suitability. Thus, by multiplying the two matrices together, disallowed transitions are removed from the allocation procedure.

### Value

A matrix.

allow 11

## NB output is only useful when used within an allocation routine
```

12 allowNeighb

allowNeighb	Implement neighbourhood decision rules
-------------	--

### Description

Identify legitimate transitions for each cell according to neighbourhood decision rules.

### Usage

```
allowNeighb(neighb, x, categories, rules, ...)
```

### **Arguments**

neighb	a NeighbMaps object
Х	a categorical RasterLayer to which neighbourhood rules should be applied. If neighb is supplied it is updated with this map
categories	numeric vector containing land use categories. If allowNeighb is called from an allocation model this argument should contain all categories in the simulation, regardless of whether they're associated with a neighbourhood decision rule
rules	a numeric vector with neighbourhood decision rules. Each rule is a value between 0 and 1 representing the threshold neighbourhood value above which change is allowed. Rules should correspond with x@categories
	additional arguments (none)

### Value

A matrix.

### See Also

```
allow, NeighbMaps
```

approxExtrapDemand 13

 ${\it approx} {\it ExtrapDemand}$ 

Extrapolate land use area in time

### **Description**

Extrapolate land use area from two or more observed land use maps to provide a valid (although not necessarily realistic) demand scenario.

### Usage

```
approxExtrapDemand(obs, tout, ...)
```

### Arguments

obs	an ObsLulcMaps object containing at least two maps
tout	numeric vector specifying the timesteps where interpolation is to take place. Comparable to the xout argument of ${\sf Hmisc::approxExtrap}$
	additional arguments to Hmisc::approxExtrap

### Details

Many allocation routines, including the two included with lulccR, require non-spatial estimates of land use demand for every timestep in the study period. Some routines are coupled to complex economic models that predict future or past land use demand based on economic considerations; however, linear extrapolation of trends remains a useful technique.

#### Value

A matrix.

### See Also

```
Hmisc::approxExtrap
```

14 as.data.frame

### **Examples**

as.data.frame

Coerce ExpVarMaps object to data.frame

### Description

This function extracts data from all raster objects in a ExpVarMaps object for a specified timestep (if dynamic variables are present).

### Usage

```
as.data.frame(x, row.names = NULL, optional = FALSE, ...)
## S4 method for signature ExpVarMaps
as.data.frame(x, row.names = NULL, optional = FALSE,
    cells, timestep = 0, ...)
```

### Arguments

Х	an ExpVarMaps object
row.names	NULL or a character vector giving the row.names for the data.frame. Missing values are not allowed
optional	logical. If TRUE, setting row names and converting column names (to syntactic names: see make.names) is optional
cells	index of cells to be extracted
timestep	numeric indicating the timestep under consideration. Only relevant if $x@maps$ contains dynamic predictor variables
	additional arguments (none)

### Value

A data.frame.

### See Also

```
as.data.frame, ExpVarMaps, partition
```

calcProb 15

#### **Examples**

calcProb

Estimate location suitability

#### **Description**

Estimate location suitability with predictive models.

### Usage

```
calcProb(object, ...)
## S4 method for signature glm
calcProb(object, newdata, ...)
## S4 method for signature rpart
calcProb(object, newdata, ...)
## S4 method for signature randomForest
calcProb(object, newdata, ...)
## S4 method for signature PredModels
calcProb(object, newdata, df = FALSE, ...)
```

### **Arguments**

object a PredModels object or a model of any class for which a predict method exists (currently, glm, rpart::rpart and randomForest::randomForest

newdata data.frame containing new data

df logical indicating whether the function should return a matrix (default) or data.frame additional arguments to predict methods

### **Details**

This function is usually called from allocate to calculate land use suitability at each timestep. However, it may also be used to produce suitability maps (see examples).

#### Value

A matrix or data.frame.

16 CluesModel

#### See Also

```
PredModels, allocate, glm, rpart::rpart, randomForest::randomForest
```

### **Examples**

```
## Sibuyan Island
## load observed land use data
obs <- ObsLulcMaps(x=sibuyan$maps,</pre>
                     pattern="lu",
                     categories=c(1,2,3,4,5),
                     labels=c("forest","coconut","grass","rice","other"),
                     t=c(0,14)
## load explanatory variables
ef <- ExpVarMaps(x=sibuyan$maps, pattern="ef")</pre>
part <- partition(x=obs@maps[[1]], size=0.5, spatial=FALSE)</pre>
efdf <- as.data.frame(x=ef, cells=part$all)</pre>
## get glm.models from data
glm.models <- sibuyan$intermediate$glm.models</pre>
probmaps <- calcProb(object=glm.models, newdata=efdf, df=TRUE)</pre>
points <- rasterToPoints(obs@maps[[1]], spatial=TRUE)</pre>
probmaps <- SpatialPointsDataFrame(coords=points, data=probmaps)</pre>
r <- rasterize(x=probmaps, y=obs@maps[[1]], field=names(probmaps))</pre>
plot(stack(r))
```

CluesModel

Create a CluesModel object

#### **Description**

Methods to create a CluesModel object to supply to allocate.

### Usage

```
CluesModel(x, ...)
## S4 method for signature ModelInput
CluesModel(x, elas, rules = NULL, nb.rules = NULL,
    params, output = NULL, ...)
```

#### **Arguments**

X	a ModelInput object
elas	numeric indicating the elasticity of each land use category to change. Elasticity varies between $0$ and $1$ , with $0$ indicating a low resistance to change and $1$ indicating a high resistance to change
rules	matrix with land use change decision rules
nb.rules	numeric with neighbourhood decision rules

CluesModel-class 17

params list with model parameters

output either a RasterStack containing output maps or NULL

... additional arguments (none)

#### **Details**

The params argument is a list of parameter values which should contain the following components:

jitter.f Parameter controlling the amount of perturbation applied to the probability surface prior to running the CLUE-S iterative algorithm. Higher values result in more perturbation. Default is 0.0001

scale.f Scale factor which controls the amount by which suitability is increased if demand is not met. Default is 0.0005

max.iter The maximum number of iterations in the simulation

 ${\tt max.diff}$  The maximum allowed difference between allocated and demanded area of any land use type. Default is 5

ave.diff The average allowed difference between allocated and demanded area. Default is 5

Note that, in order to achieve convergence, it is likely that some adjustment of these parameters will be required.

#### Value

A CluesModel object.

#### References

Verburg, P.H., Soepboer, W., Veldkamp, A., Limpiada, R., Espaldon, V., Mastura, S.S. (2002). Modeling the spatial dynamics of regional land use: the CLUE-S model. Environmental management, 30(3):391-405.

CluesModel-class CluesModel

#### **Description**

An S4 class to represent inputs to the CLUE-S land use change model.

18 compareAUC

#### **Slots**

```
obs an ObsLulcMaps object
ef an ExpVarMaps object
models a PredModels object
time numeric vector of timesteps over which simulation will occur
demand matrix containing demand scenario or NULL
hist RasterLayer showing land use history or NULL
mask RasterLayer showing masked areas or NULL
neighb NeighbMaps object or NULL
categories numeric vector of land use categories
labels character vector corresponding to categories
output RasterStack containing simulated land use maps or NULL
rules matrix with land use change decision rules
nb.rules numeric with neighbourhood decision rules
elas numeric indicating elasticity to change (only required for
params list with model parameters
```

compareAUC

Calculate the area under the ROC curve (AUC)

#### **Description**

Estimate the AUC for each ROCR::prediction object in a Prediction object.

### Usage

```
compareAUC(pred, ...)
## S4 method for signature Prediction
compareAUC(pred, digits = 4, ...)
## S4 method for signature list
compareAUC(pred, digits = 4, ...)
```

#### **Arguments**

pred a Prediction object or a list of these
digits numeric indicating the number of digits to be displayed after the decimal point
for AUC values
... additional arguments (none)

### **Details**

The user can compare the performance of different statistical models by providing a list of Prediction objects. Note that compareAUC should be used in conjunction with other comparison methods because the AUC does not contain as much information as, for instance, the ROC curve itself (Pontius and Parmentier, 2014).

crossTabulate 19

#### Value

A data.frame.

#### References

crossTabulate

Cross tabulate land use transitions

### **Description**

Cross tabulate land use transitions using raster::crosstab. This step should form the basis of further research into the processes driving the most important transitions in the study region (Pontius et al., 2004).

### Usage

```
crossTabulate(x, y, ...)
## S4 method for signature RasterLayer,RasterLayer
crossTabulate(x, y, categories,
    labels = as.character(categories), ...)
## S4 method for signature ObsLulcMaps,ANY
crossTabulate(x, y, index, ...)
```

### Arguments

Х		RasterLayer representing land use map from an earlier timestep or an ObsLul- cMaps object containing at least two land use maps for different points in time
у		RasterLayer representing land use map from a later timestep. Not used if $\boldsymbol{x}$ is an ObsLulcMaps object
С	ategories	numeric vector containing land use categories to consider. Not used if x is an ObsLulcMaps object
1	abels	character vector (optional) with labels corresponding to categories. Not used if x is an ObsLulcMaps object
i	ndex	numeric vector with index of land use maps from ObsLulcMaps to use in analysis
		additional arguments to raster::crosstab

20 ExpVarMaps

#### Value

A data.frame.

#### References

Pontius Jr, R.G., Shusas, E., McEachern, M. (2004). Detecting important categorical land changes while accounting for persistence. Agriculture, Ecosystems & Environment 101(2):251-268.

#### See Also

```
ObsLulcMaps, raster::crosstab
```

#### **Examples**

ExpVarMaps

Create an ExpVarMaps object

#### **Description**

Methods to load maps of explanatory variables, which may be created from file, an existing Raster\* object or a list of Raster\* objects.

### Usage

```
ExpVarMaps(x, pattern, ...)
## S4 method for signature missing, character
ExpVarMaps(x, pattern, ...)
## S4 method for signature character, character
ExpVarMaps(x, pattern, ...)
## S4 method for signature RasterStack, character
ExpVarMaps(x, pattern, ...)
## S4 method for signature list, character
ExpVarMaps(x, pattern, ...)
```

ExpVarMaps-class 21

#### **Arguments**

x path (character) to directory containing observed land use maps, a Raster\* object

or a list of Raster\* objects

pattern regular expression (character). Only filenames (if x is a path) or Raster\* objects

(if x is a list) matching the regular expression will be returned. See raster::raster for more information about supported filetypes

... additional arguments to raster::stack

#### **Details**

Explanatory variables should follow a naming convention to identify them as static (one map provided for the study period) or dynamic (one map provided for each year of the study period). The name should consist of two (static) or three (dynamic) parts: firstly, the prefix should differentiate explanatory variables from other maps in the directory, list or RasterStack. This should be followed by a unique number to differentiate the explanatory variables (note that the order of variables in the ExpVarMaps object is determined by this value) If the variable is dynamic this number should be followed by a second number representing the timestep to which the map applies. Dynamic variables should include a map for time 0 (corresponding to the initial observed map) and every subsequent timestep in the simulation. The different parts should be separated by a period or underscore.

Maps of different explanatory variables should have the same coordinate reference system but do not have to have the same extent and resolution as long as the minimum extent is that of the study region defined by an ObsLulcMaps object. However, maps for different timesteps of the same dynamic variable should have the same extent and resolution because these are stored as RasterStack objects.

#### Value

An ExpVarMaps object.

#### See Also

```
raster::stack
```

### **Examples**

```
## Plum Island Ecosystems
ef <- ExpVarMaps(x=pie, pattern="ef")
## Sibuyan
ef <- ExpVarMaps(x=sibuyan$maps, pattern="ef")</pre>
```

ExpVarMaps-class

Class ExpVarMaps

#### **Description**

An S4 class for explanatory variables.

22 FigureOfMerit

#### **Slots**

maps list of RasterStack objects. The length of the list corresponds to the number of explanatory variables and the number of layers in each RasterStack represents time

varnames character vector with the name of each variable in maps dynamic logical indicating whether dynamic variables are present

FigureOfMerit

Create a FigureOfMerit object

#### **Description**

Calculate the figure of merit at different levels and at different resolutions for a reference map at time 1, a reference map at time 2 and a simulated map at time 2.

#### Usage

```
FigureOfMerit(x, ...)
## S4 method for signature RasterLayer
FigureOfMerit(x, ...)
## S4 method for signature ThreeMapComparison
FigureOfMerit(x, ...)
```

### **Arguments**

x a ThreeMapComparison object or RasterLayer
 ... additional arguments to ThreeMapComparison. Only required if x is not a ThreeMapComparison object

#### **Details**

In land use change modelling the figure of merit is the intersection of observed change and simulated change divided by the union of these, with a range of 0 (perfect disagreement) to 1 (perfect agreement). It is useful to calculate the figure of merit at three levels: (1) considering all possible transitions from all land use categories, (2) considering all transitions from specific land use categories and (3) considering a specific transition from one land use category to another.

### Value

A FigureOfMerit object.

#### References

Pontius Jr, R.G., Peethambaram, S., Castella, J.C. (2011). Comparison of three maps at multiple resolutions: a case study of land change simulation in Cho Don District, Vietnam. Annals of the Association of American Geographers 101(1): 45-62.

```

FigureOfMerit-class 23

#### **Examples**

FigureOfMerit-class Class FigureOfMerit

### **Description**

An S4 class for different figure of merit scores.

#### **Slots**

tables list of data.frames that depict the three dimensional table described by Pontius et al. (2011) at different resolutions

factors numeric vector of aggregation factors

categories numeric vector of land use categories

labels character vector corresponding to categories

overall list containing the overall figure of merit score for each aggregation factor

category list of numeric vectors containing category specific scores

transition list of matrices containing transition specific scores

FigureOfMerit.plot Plot method for FigureOfMerit objects

### Description

Plot the overall, category-specific or transition-specific figure of merit at different resolutions.

### Usage

```
FigureOfMerit.plot(x, ...)
## S4 method for signature FigureOfMerit
FigureOfMerit.plot(x, from, to,
  col = RColorBrewer::brewer.pal(8, "Set2"), type = "b", key, scales, xlab,
  ylab, ...)
```

24 Model-class

### **Arguments**

X	a FigureOfMerit object
from	optional numeric value representing a land use category. If provided without to the figure of merit for all transitions from this category will be plotted
to	similar to from. If provided with a valid from argument the transition defined by these two arguments (i.e. from -> to) will be plotted. It is possible to include more than one category in which case the different transitions will be included on the same plot
col	character specifying the plotting colour. Default is to use the 'Set2' palette from RColorBrewer
type	character. See lattice::panel.xyplot
key	list. See lattice::xyplot
scales	list. See lattice::xyplot
xlab	character or expression. See lattice::xyplot
ylab	character or expression. See lattice::xyplot
• • •	additional arguments to lattice::xyplot

#### Value

A trellis object.

#### See Also

```
FigureOfMerit, lattice::xyplot, lattice::panel.xyplot
```

### **Examples**

```
## see FigureOfMerit examples
```

Model-class	Virtual class Model	

### **Description**

A virtual S4 class to represent land use change models.

### Slots

```
obs an ObsLulcMaps object
ef an ExpVarMaps object
models a PredModels object
time numeric vector of timesteps over which simulation will occur
demand matrix containing demand scenario or NULL
hist RasterLayer showing land use history or NULL
mask RasterLayer showing masked areas or NULL
neighb NeighbMaps object or NULL
categories numeric vector of land use categories
labels character vector corresponding to categories
output RasterStack containing simulated land use maps or NULL
```

ModelInput 25

### Description

Methods to combine several object classes that are useful for land use change modelling and perform checks to ensure the objects are compatible in time and space for a model simulation.

### Usage

```
ModelInput(obs, ef, models, time, demand, ...)
## S4 method for signature ObsLulcMaps,ExpVarMaps,PredModels,numeric,matrix
ModelInput(obs, ef,
   models, time, demand, hist, mask, neighb = NULL, ...)
```

### Arguments

obs	an ObsLulcMaps or ModelInput object
003	all ObsEdictilaps of Woderniput object
ef	an ExpVarMaps object
models	a PredModels object
time	numeric vector containing timesteps over which simulation will occur
demand	matrix with demand for each land use category in terms of number of cells to be allocated. The first row should be the number of cells allocated to the initial observed land use map (i.e. the land use map for time 0)
hist	RasterLayer containing land use history (values represent the number of years the cell has contained the current land use category)
mask	RasterLayer containing binary values where 0 indicates cells that are not allowed to change
neighb	an object of class NeighbMaps
	additional arguments (none)

### Value

A ModelInput object.

### See Also

```
ModelInput-class
```

```
## see lulccR-package examples
```

26 NeighbMaps

ModelInput-class

Class ModelInput

#### **Description**

An S4 class to represent land use change model inputs.

#### **Slots**

```
obs an ObsLulcMaps object
ef an ExpVarMaps object
models a PredModels object
time numeric vector containing timesteps over which simulation will occur
demand matrix containing demand scenario or NULL
hist RasterLayer showing land use history or NULL
mask RasterLayer showing masked areas or NULL
neighb NeighbMaps object or NULL
categories numeric vector of land use categories
labels character vector corresponding to categories
```

NeighbMaps

Create a NeighbMaps object

### Description

Methods to calculate neighbourhood values for cells in raster maps using raster::focal. By default the fraction of non-NA cells within the moving window (i.e. the size of the weights matrix) devoted to each land use category is calculated. This behaviour can be changed by altering the weights matrix or providing an alternative function. The resulting object can be used as the basis of neighbourhood decision rules.

### Usage

```
NeighbMaps(x, categories, weights, neighb, ...)
## S4 method for signature RasterLayer,numeric,list,ANY
NeighbMaps(x, categories, weights,
    neighb, fun = mean, ...)
## S4 method for signature RasterLayer,numeric,numeric,ANY
NeighbMaps(x, categories, weights,
    neighb, fun = mean, ...)
## S4 method for signature RasterLayer,ANY,ANY,NeighbMaps
NeighbMaps(x, categories, weights,
    neighb)
```

NeighbMaps 27

#### **Arguments**

RasterLayer containing categorical data numeric vector containing land use categories for which neighbourhood values categories should be calculated weights list containing a matrix of weights (the w argument in focal) for each land use category or a numeric vector specifying the size of each weights matrix. In the latter case only square matrices are possible and all weights are given a value of 1. The order of list or vector elements should correspond to the order of land use categories in categories neighb NeighbMaps object. Only used if categories and weights are not provided. This option can be useful when existing NeighbMaps objects need to be updated because a new land use map is available, such as during the allocation procedure. fun function. Input argument to focal. Default is mean additional arguments to raster::focal

#### Value

A NeighbMaps object.

#### See Also

```
NeighbMaps-class, allowNeighb, raster::focal
```

```
## observed data
obs <- ObsLulcMaps(x=pie,</pre>
                     pattern="lu",
                     categories=c(1,2,3),
                     labels=c("forest","built","other"),
                     t=c(0,6,14))
## create a NeighbMaps object for 1985 land use map
nb1 <- NeighbMaps(x=obs@maps[[1]],</pre>
                   categories=c(1,2,3), # all land use categories
                   weights=c(3,3,3))
                                                # 3*3 neighbourhood
w1 <- matrix(data=c(1,1,1,</pre>
                     1.1.1.
                     1,1,1), nrow=3, ncol=3, byrow=TRUE)
w2 <- matrix(data=c(1,1,1,</pre>
                     1,1,1), nrow=3, ncol=3, byrow=TRUE)
w3 <- matrix(data=c(1,1,1,</pre>
                     1,1,1,
                     1,1,1), nrow=3, ncol=3, byrow=TRUE)
nb2 <- NeighbMaps(x=obs@maps[[1]],</pre>
                   categories=c(1,2,3),
                   weights=list(w1,w2,w3))
```

28 ObsLulcMaps

NeighbMaps-class

Class NeighbMaps

### **Description**

An S4 class for neighbourhood maps.

### **Slots**

maps list of RasterLayers showing neighbourhood values for each land use in categories categories numeric vector of land use categories for which neighbourhood maps exist weights list of weights matrices

fun function used to calculate neighbourhood values

focal.args list of all other arguments supplied to raster::focal

ObsLulcMaps

Create an ObsLulcMaps object

### Description

Methods to create an ObsLulcMaps object, which may be created from file, an existing Raster\* object or a list of Raster\* objects.

### Usage

```
ObsLulcMaps(x, pattern, ...)
## S4 method for signature missing, character
ObsLulcMaps(x, pattern, ...)
## S4 method for signature character, character
ObsLulcMaps(x, pattern, ...)
## S4 method for signature list, character
ObsLulcMaps(x, pattern, ...)
## S4 method for signature RasterLayer, ANY
ObsLulcMaps(x, pattern, ...)
## S4 method for signature RasterStack, ANY
ObsLulcMaps(x, pattern, categories, labels, t)
```

ObsLulcMaps-class 29

### **Arguments**

x	path (character), Raster* object or list of Raster* objects. Default behaviour is to search for files in the working directory
pattern	regular expression (character). Only filenames (if x is a path) or Raster* objects (if x is a list) matching the regular expression will be returned. See raster::raster for more information about supported filetypes
categories	numeric vector of land use categories in observed maps
labels	character vector (optional) with labels corresponding to categories
t	numeric vector containing the timestep of each observed map. The first timestep must be $\boldsymbol{0}$
	additional arguments to raster::stack

#### **Details**

Observed land use maps should have the same extent and resolution. The location of non-NA cells in ObsLulcMaps objects defines the region for subsequent analysis.

#### Value

An ObsLulcMaps object.

### See Also

```
ObsLulcMaps-class, raster::stack
```

### **Examples**

ObsLulcMaps-class

Class ObsLulcMaps

### **Description**

An S4 class for observed land use maps.

30 OrderedModel

#### **Slots**

maps RasterStack containing observed land use maps
t numeric vector with timesteps corresponding to each observed map
categories numeric vector of land use categories
labels character vector corresponding to categories

OrderedModel

Create an OrderedModel object

#### **Description**

Methods to create a OrderedModel object to supply to allocate.

### Usage

```
OrderedModel(x, ...)
## S4 method for signature ModelInput
OrderedModel(x, rules = NULL, nb.rules = NULL, order,
    params, output = NULL, ...)
```

### **Arguments**

Х	a ModelInput object
rules	matrix with land use change decision rules
nb.rules	numeric with neighbourhood decision rules
order	numeric vector of land use categories in the order that change should be allocated. See Details
params	list with model parameters
output	either a RasterStack containing output maps or NULL
• • •	additional arguments (none)

#### **Details**

The params argument is a list of parameter values which should contain the following components:

 ${\tt max.diff}$  The maximum allowed difference between allocated and demanded area of any land use type. Default is 5

#### Value

An OrderedModel object.

#### References

Fuchs, R., Herold, M., Verburg, P.H., and Clevers, J.G.P.W. (2013). A high-resolution and harmonized model approach for reconstructing and analysing historic land changes in Europe, Biogeosciences, 10:1543-1559.

OrderedModel-class

Class OrderedModel

### **Description**

An S4 class to represent inputs to the Ordered allocation procedure

#### **Slots**

```
obs an ObsLulcMaps object

ef an ExpVarMaps object

models a PredModels object

time numeric vector of timesteps over which simulation will occur

demand matrix containing demand scenario or NULL

hist RasterLayer showing land use history or NULL

mask RasterLayer showing masked areas or NULL

neighb NeighbMaps object or NULL

categories numeric vector of land use categories

labels character vector corresponding to categories

output RasterStack containing simulated land use maps or NULL

rules matrix with land use change decision rules

nb.rules numeric with neighbourhood decision rules

order numeric vector of land use categories in the order that change should be allocated params list with model parameters
```

partition

Partition raster data

### **Description**

Divide a categorical raster map into training and testing partitions. A wrapper function for caret::createDataPartition (Kuhn, 2008) to divide a categorical raster map into training and testing partitions.

### Usage

```
partition(x, size = 0.5, spatial = TRUE, ...)
```

32 Performance

### **Arguments**

X	RasterLayer with categorical data
size	numeric value between zero and one indicating the proportion of non-NA cells that should be included in the training partition. Default is 0.5, which results in equally sized partitions
spatial	logical. If TRUE, the function returns a SpatialPoints object with the coordinates of cells in each partition. If FALSE, the cell numbers are returned
	additional arguments (none)

#### Value

A list containing the following components:

train a SpatialPoints object or numeric vector indicating the cells in the training partition test a SpatialPoints object or numeric vector indicating the cells in the testing partition all a SpatialPoints object or numeric vector indicating all non-NA cells in the study region

Performance-class

Class Performance

### **Description**

An S4 class that extends ROCR::performance-class to hold the results of multiple model evaluations.

#### Slots

performance list of ROCR performance objects. Each object is calculated for the corresponding ROCR prediction object held in the Prediction object supplied to the constructor function auc numeric vector containing the area under the ROC curve for each performance object categories numeric vector of land use categories for which performance objects were created labels character vector with labels corresponding to categories

Performance.plot

Plot method for Performance objects

### Description

Plot the the ROC curve for each performance object in a Performance object. If more than one Performance objects are provided ROC curves for the same land use category from different objects are included on the same plot for model comparison.

### Usage

```
Performance.plot(x, ...)
## S4 method for signature list
Performance.plot(x, multipanel = TRUE, type = "l",
   abline = list(c(0, 1), col = "grey"), col = RColorBrewer::brewer.pal(9, "Set1"), key.args = NULL, ...)
```

pie 35

#### **Arguments**

x either a single Performance object or a list of these. If a list is provided it must

be named.

multipanel logical. If TRUE, create a trellis plot where the number of panels equals the

number of Performance objects. Otherwise, create a single plot for each Per-

formance object

pie

Land use change dataset for Plum Island Ecosystem

### **Description**

Dataset containing land use maps for 1985, 1991 and 1999 and several explanatory variables derived from Pontius and Parmentier (2014).

### Usage

pie

#### **Format**

A list containing the following elements:

lu\_pie\_1985 RasterLayer showing land use in 1985 (forest, built, other)

lu\_pie\_1991 RasterLayer showing land use in 1991

lu\_pie\_1999 RasterLayer showing land use in 1999

ef\_001 RasterLayer showing elevation

ef\_002 RasterLayer showing slope

ef\_003 RasterLayer showing distance to built land in 1985

Prediction Create a Prediction object

### Description

This function creates a ROCR::prediction object for each predictive model in a PredModels object. It should be used with Performance to evaluate multiple models with exactly the same criteria while keeping track of which model corresponds to which land use category.

### Usage

```
Prediction(models, obs, ef, timestep = 0, partition, ...)
```

#### **Arguments**

models	a PredModels object
obs	an ObsLulcMaps object
ef	an ExpVarMaps object
timestep	numeric indicating the timestep of the observed map in obs against which the observed map should be tested
partition	index of cells for which occurrence should be predicted
	additional arguments to ROCR::prediction

### Value

A Prediction object.

Prediction-class 37

Prediction-class	Class Prediction	

### Description

An S4 class that extends ROCR::prediction-class to hold the results of multiple model predictions.

#### **Slots**

prediction a list of ROCR::prediction-class objects. These objects are calculated for each
 statistical model in the PredModels object supplied to the constructor function
categories numeric vector of land use categories for which prediction objects were created
labels character vector with labels corresponding to categories

PredModels

Create a PredModels object

#### **Description**

Methods to create a PredModels-class object.

### Usage

```
PredModels(models, obs, categories, labels, ...)
## S4 method for signature list,ObsLulcMaps,ANY,ANY
PredModels(models, obs, categories, labels, ...)
## S4 method for signature list,ANY,numeric,character
PredModels(models, obs, categories, labels, ...)
```

### **Arguments**

models	a list of predictive models corresponding to obs@categories or categories
obs	an ObsLulcMaps object
categories	numeric vector of land use categories in observed maps. Only required if obs is not provided
labels	character vector (optional) with labels corresponding to categories. Only required if obs is not provided $% \left( 1\right) =\left( 1\right) \left( $
	additional arguments (none)

#### Value

A PredModels object.

## view plot
print(p)
```

PredModels-class

Class PredModels

#### **Description**

An S4 class to hold multiple mathematical models for different land use categories belonging to the same map.

### **Slots**

```
models list of predictive models

categories numeric vector of land use categories

labels character vector with labels corresponding to categories
```

40 resample

resample

Resample maps in ExpVarMaps object or list

### Description

A wrapper function for raster::resample to resample raster objects in an ExpVarMaps object or list.

### Usage

```
resample(x, y, ...)
## S4 method for signature ExpVarMaps,Raster
resample(x, y, method = "ngb", ...)
## S4 method for signature list,Raster
resample(x, y, method = "ngb", ...)
```

### Arguments

X	an ExpVarMaps object or list of Raster* maps to be resampled
у	Raster* object with parameters that x should be resampled to
method	method used to compute values for the new RasterLayer, should be "bilinear" for bilinear interpolation, or "ngb" for nearest neighbour
	additional arguments to raster::resample

### Value

An ExpVarMaps object or list, depending on x.

### See Also

```
ExpVarMaps, raster::resample
```

```
## create ExpVarMaps object
ef <- ExpVarMaps(x=pie, pattern="ef")

## resample to ensure maps have same characteristics as observed maps
ef <- resample(x=ef, y=pie$lu_pie_1985, method="ngb")</pre>
```

roundSum 41

roundSum

Round elements in matrix or data.frame rows

#### **Description**

Round all numbers in a matrix or data.frame while ensuring that all rows sum to the same value.

#### Usage

```
roundSum(x, ncell, ...)
```

#### **Arguments**

```
x matrix or data.framencell numeric specifying the target sum for each row in xadditional arguments (none)
```

#### **Details**

The main application of roundSum is to ensure that each row in the demand matrix specifies exactly the number of cells to be allocated to each land use category for the respective timestep. It may also be used to convert the units of demand to number of cells, as required by ModelInput.

### Value

A matrix.

#### **Examples**

```
## Sibuyan Island
## load demand scenario from data
dmd <- sibuyan$demand$demand1 * runif(1)
ncell <- length(which(!is.na(getValues(sibuyan$maps$lu_sib_1997))))
## recover demand
dmd <- roundSum(dmd, ncell=ncell)</pre>
```

sibuyan

Land use change dataset for Sibuyan Island

### **Description**

Dataset containing land use map for 1997 and several explanatory variables for Sibuyan Island derived from Verburg et al. (2002). Data are modified by Peter Verburg to demonstrate the CLUE-s model; as such the dataset should not be used for purposes other than demonstration.

### Usage

sibuyan

#### **Format**

A list containing the following components:

maps list containing the following RasterLayers:

lu\_sib\_1997 RasterLayer with land use in 1997 (forest, coconut, grassland, rice, other)

ef\_001 RasterLayer showing distance to sea

ef\_002 RasterLayer showing mean population density

ef\_003 RasterLayer showing occurrence of diorite rock

ef 004 RasterLayer showing occurrence of ultramafic rock

ef\_005 RasterLayer showing occurrence of sediments

ef\_006 RasterLayer showing areas with no erosion

ef\_007 RasterLayer showing areas with moderate erosion

ef\_008 RasterLayer showing elevation

ef\_009 RasterLayer showing slope

ef\_010 RasterLayer showing aspect

ef 011 RasterLayer showing distance to roads in 1997

ef 012 RasterLayer showing distance to urban areas in 1997

ef\_013 RasterLayer showing distance to streams

restr1 RasterLayer showing location of current national park

restr2 RasterLayer showing location of proposed national park

**demand** list of matrices with different demand scenarios:

demand1 data.frame with demand scenario representing slow growth scenario

demand2 data.frame with demand scenario representing fast growth scenario

**demand3** data.frame with demand scenario representing land use change primarily for food production

intermediate list of two intermediate outputs, for demonstration purposes:

**glm.models** PredModels object representing Sibuyan land use categories **clues.model** CluesModel object

#### References

Verburg, P.H., Soepboer, W., Veldkamp, A., Limpiada, R., Espaldon, V., Mastura, S.S (2002). Modeling the Spatial Dynamics of Regional Land Use: The CLUE-S Model. Environmental Management 30(3): 391-405.

ThreeMapComparison

Evaluate allocation performance with three maps

#### **Description**

An implementation of the method described by Pontius et al. (2011), which compares a reference map at time 1, a reference map at time 2 and a simulated map at time 2 to evaluate allocation performance at multiple resolutions while taking into account persistence. The method quantifies disagreement within coarse squares (minor allocation disagreement), disagreement between coarse squares (major allocation disagreement), disagreement about the quantity of land use change and agreement.

ThreeMapComparison

43

#### Usage

```
ThreeMapComparison(x, x1, y1, ...)
## S4 method for signature Model,ANY,ANY
ThreeMapComparison(x, x1, y1, factors, timestep, ...)
## S4 method for signature RasterLayer,RasterLayer,RasterLayer
ThreeMapComparison(x, x1, y1,
  factors, categories, labels, ...)
```

#### **Arguments**

Х		either a RasterLayer of observed land use at time 0 or an object inheriting from class Model
x1		a RasterLayer of observed land use at a subsequent time. Only required if x is also a RasterLayer
y1		a Raster Layer of simulated land use corresponding to $x1$ . Only required if x is also a Raster Layer
facto	ors	numeric vector of aggregation factors (equivalent to the 'fact' argument to raster::aggregate representing the resolutions at which model performance should be tested
times	step	numeric value indicating the timestep of the simulated land use map. Only required if $\boldsymbol{x}$ is a Model object
categ	gories	numeric vector of land use categories in observed maps. Only required if $\boldsymbol{x}$ is a RasterLayer
label	ls	character vector (optional) with labels corresponding to categories. Only required if ${\bf x}$ is a RasterLayer
		additional arguments to raster::aggregate

#### Value

A ThreeMapComparison object.

#### References

Pontius Jr, R.G., Peethambaram, S., Castella, J.C. (2011). Comparison of three maps at multiple resol utions: a case study of land change simulation in Cho Don District, Vietnam. Annals of the Association of American Geographers 101(1): 45-62.

## get CluesModel object from data
sib.clues.model <- sibuyan$intermediate$clues.model
## validation</pre>
```

44 total

ThreeMapComparison-class

Class ThreeMapComparison

### **Description**

An S4 class to hold results of a comparison between a reference map for time 1, a reference map for time 2 and a simulation map for time 2 using the the method described by Pontius et al. (2011).

#### **Slots**

tables list of data.frames that depict the three dimensional table described by Pontius et al. (2011) at different resolutions

factors numeric vector of aggregation factors categories numeric vector of land use categories labels character vector corresponding to categories

### References

Pontius Jr, R.G., Peethambaram, S., Castella, J.C. (2011). Comparison of three maps at multiple resol utions: a case study of land change simulation in Cho Don District, Vietnam. Annals of the Association of American Geographers 101(1): 45-62.

total

Total number of cells in a categorical Raster\* object

#### **Description**

Count the number of cells belonging to each category in a Raster\* object.

### Usage

```
total(x, categories)
```

### Arguments

x Raster\* object

categories numeric vector containing land use categories. Only cells belonging to these categories will be counted

total 45

### Value

A list containing the following components:

total a matrix containing the total number of cells belonging to each category. Rows represent layers in the input Raster\* object

categories the categories included in the calculation

```
## RasterLayer
total(x=sibuyan$maps$lu_sib_1997)

## RasterStack
total(x=stack(pie$lu_pie_1985, pie$lu_pie_1991, pie$lu_pie_1999))
```
